Application No.: 09/857,281 2 Docket No.: 449122016600

AMENDMENTS TO THE CLAIMS

1 (Currently amended). A computer readable medium containing program instruction which when executed on a computer, perform a process for designing a technical system, the process comprising:

- a) providing a substitute model that describes measurement data of a predetermined system;
- b) determining a numerical value for a quality of said substitute model by comparing said measurement data of said predetermined system with data determined by said substitute model;
- c) adapting said substitute model from said numerical value for said quality to be as high of a quality as possible;
- d) applying said substitute model adapted with regard to its quality in a design of said technical system;
- e) sorting said measurement data according to their quality, with respect to the deviation of the latter from said data determined by said substitute model; and
 - f) picking out a predetermined number of n% of worst measurement data.
- 2 (previously presented). The computer readable medium as claimed in claim 1, wherein said substitute model is a regression model.
- 3 (previously presented). The computer readable medium as claimed in claim 1, wherein determining a numerical value for a quality further utilizes a mean square deviation of said measurement data from said data determined by said substitute model.
 - 4 (canceled)
- 5 (previously presented). The computer readable medium as claimed in claim 1, further comprising:

Docket No.: 449122016600

sorting said measurement data according to their quality, with respect to the deviation of the latter from said data determined by said substitute model; and picking out a predetermined number of n% of worst measurement data unless this data lie in a continuous range.

3

6 (previously presented). The computer readable medium as claimed in claim 1, further comprising:

reducing an amount of measurement data in the course of a preprocessing operation.

7 (previously presented). The computer readable medium as claimed in claim 6, further comprising:

classifying, in said preprocessing operation, of said measurement data.

8 (previously presented). The computer readable medium as claimed in claim 1, further comprising:

controlling a technical plant utilizing said data obtained by designing.

9 (previously presented). The computer readable medium as claimed in claim 8, further comprising:

online adaptive control for said technical plant.

- 10 (currently amended). An apparatus for designing a technical system, comprising: a processor unit which is set up in such a way that
- a) measurement data of a predetermined system are described based on a substitute model and stored in said processor unit;
- b) a numerical value for a quality of said substitute model is determined by said processor unit by comparing said measurement data of the predetermined system with data determined by said substitute model; and

Application No.: 09/857,281 4 Docket No.: 449122016600

c) said substitute model is adapted, utilizing said processor unit, from said numerical value for said quality to be as of high a quality as possible, wherein said substitute model adapted with regard to its quality is used for designing said technical system;

- d) said measurement data is sorted according to their quality, with respect to the deviation of the latter from said data determined by said substitute model; and
 - e) picking out a predetermined number of n% of worst measurement data.
